How to choose the right aluminum arrow without graphs! Here's the thing: There are only nine arrow spikes you need to start with bows from about 18 to about 100. (Note that this is an approximation and you will see why in a second). В GENERAL для 28 ARROWS (-1 (27 - 29) и 100 - 125gr головки: 18 - 23 151624 - 27 161628 - 33 171634 - 42 181643 - 53 171634 - 42 181643 - 53 171634 - 42 181643 2 191653 - 60 201661 - 70 211771 - 80 2216 81 - 100 2219 (Может захотеть играть с 23хх, 24хх и большие валы, как он может получить немного рискованно на эти веса, так как эффективность лука начинает уменьшаться после определенного веса.) Если вы идете к 30стрелы, прыгать вверх один номер позвоночника, если вы идете на 32 стрелка, а затем идти вверх два позвоночника номера. То же самое для собирается короче, 26 один позвоночник вниз, 24 два шипа вниз. Вес головы также повлияет на позвоночник, однако, это потребует 45-50 зерен, чтобы перейти один номер позвоночника. Например If you remove 40 bows and using 29 1816 with 100 grams of head, going 150 grain head may require you to go to 1916. This will not give you the perfect aluminum arrow for this onion. This will give you a customizable arrow and that's all you need for beginners. Once the arrow is set up, you'll know if you're making up for the hard or soft arrow with customization requirements. Then you can fine-tune the choice of arrow by juggling wall thicknesses and diameters. For example, if you have #41 28 bows and use 29 arrows, you'd pick 1816, wouldn't you? And it would have worked. If you find that you have to move the rest/kick plate a little more than you want, then your next set of arrows may be 1914s. They have the same weight as the 1816s, but are a little tougher. As for fastflight fight (low mass/low stretch) line. The difference between Dacron and FF is about 5, at worst, so if the right arrow was chosen in the first place, it should still be within the customizable parameters. Also, if I know a particular bow, I could suggest an arrow that is not a major spine number. A certain #57 onion can work very well with 2114, for example. For example, 2016 has a diameter of 20/64 (or 5/16) and a wall thickness of 16/1000. The following is a diagram of the spine for a wood shaft shot of longbows. For recursion and high performance longbows add 5-10 bow weight. For selfbows, subtract 5-10 onion weight. For high performance repeats add 10-15 onion weight. For 160 cereal points add 5 onion weight. For 190 cereal points the ad is 10 onion weight. This diagram of the spine does not reflect the bare results of the shaft testing. We don't recommend testing a bare shaft, but if you insist on using this method, select 3 sizes, starting with the one offered on the next chart, and the next two higher sizes. Next spine chart for Easton shaft shot of recurs and high performance longbows. For high performance Add 5-10 onion weight. For regular longbows, subtract 5 onion weights. This diagram of the spine does not reflect the bare results of the shaft testing. We don't recommend testing a bare shaft, but if you insist on using this method, select 3 sizes, starting with the one offered on the next chart, and the next two higher sizes. Below are the results of my spine testing various aluminum shafts. All were made on Scheib spine testor and in 26 centers. I used the same method as I would if I did a tree tree. Left readings for xx-75 quality shafts. Others are aluminum shafts with less alloy in its composition, like the old Gamegetter or 24SRT shaft. Check out our frequently asked questions first. If that doesn't answer your questions, then: Call us: 801.539.14007:30 am - 3:30 p.m. MST 5040 Harold Gattl Dr., Salt Lake City, UTAH, USA Talk Starter and #1 October 17, 2017 I'm sure it exists, sorry if it's been suggested a lot already. I'm looking for a diagram that shows the spine of aluminum arrows/appropriate arrows. for example- what is an equivalent 500 or 600 of the carbon arrow's spine of an aluminum arrow. I want to shoot like, at least for a while. I have a saw arrow (old but still working well) and a grain/gram scale so I can make them identical as much as possible. Thank you for your answers. - Easton Arrow catalogs was what you need to try out their website Easton's website has charts showing the spine deviation numbers for different types of aluminum arrows series XX75; but I don't see this kind of diagram for other Easton aluminum arrows. Easykeeper or nickle: Do you think we can assume that the number of spinal deviations would be the same for Easton's other aluminium arrows of equivalent diameter and wall thickness? Different types of aluminum will have slightly different material properties, and these properties are part of what is included in the

measured static deviation. I think the more important variables of the outer diameter are against the internal diameter (the thickness of the wall). Difference in material properties is likely to come into play with a dynamic spine. I think, and I honestly don't know for sure, is that other varieties or models of aluminum shafts from Easton will be close enough to what are listed for Platinum Plus shafts to be essentially the same as the static spine goes. Whether they adjust the same (dynamic spine) will be a question for the person to figure out. · Discussion Starter and #6 October 17, 2017 Thank you for all your inputs, direction, sites and all. I appreciate it. · Go to this Easton site, it shows all its aluminum arrows and matching weights and spikes each. Also, the only thing you can get in a match is between .500 carbon spine and .500 spine aluminum Length. Usually the aluminium arrow of an equal spine is heavier than an inch than carbon. Maybe look at the carbon-wrapped aluminum combinations to get heavier carbon arrows. · · makes a good point. The shafts of the same static spikes will not necessarily have the same dynamic spikes, especially when comparing carbon or aluminum shafts. The difference in weight between the shafts of identical spine compounds is a matter. I think the 3Rivers spine calculator is probably about the best way to compare the specifications of the shaft... you need to know that the reference shaft is correct through the setting, then you could fit something else and be relatively close. Perhaps you still need to customize to get the best melody for everyone. · I'm sure she exists, sorry if she has been asked a lot already. I'm looking for a diagram that shows the spine of aluminum arrows/appropriate arrows. for example- what is an equivalent 500 or 600 of the carbon arrow's spine of an aluminum arrow. I want to shoot like, at least for a while. I have a saw arrow (old but still working well) and a grain/gram scale so I can make them identical as much as possible. Thank you for your answers. Just. Be always careful to see many over emphasizing arrows of all types and yes saw many end up with an exploded shaft in the hands of staying not very spectacle seeing anybody wounded in the war or a hobby of staying safe and enjoy seen by many when I won the State of Dina bow offere shoot their Fred bear giving me old 2018 orange ramparts when no one could get something lucky me shooting 60lbs, and then back in the 80s had to be 50 to 60 I stayed in that for the comp many went higher in pounds and way easier on the mines yes Dina bow was one bow camera and 80 percent letoff it was quick if you were good at getting off the line smooth I shot my fingers helped I cut my black widow tab real short I was just about holding a string of knots on the but I had to learn to do a much smoother release of all the bows before Shandlis Jennings wood handled Jennings stacked hard release wasn't a hard 80 percent brand new ball game, but I got it down and won the second year b Dina bow first 139 dollars bear polar ltd lol, but I practiced and lived with a gun or bow or pellets of a gun or hunting all types and trapped as a child loved the woods, then 26 years retired team sarg basic army scout forest time again with the camera even the bow got bored for me, but after the fight I just couldn't kill any more animals, so I'm going to teach the pursuit I loved that and I had a good natural fun time all the airborne scout from !!!? Sent from my Moto E (4) via Tapataik Tapataik aluminum arrow spine chart recurve. aluminum arrow spine chart easton
